Richland, WA (Open to relocation to Westbrook, MA)

Computational Protein Engineering | ML-Guided Enzyme Design | Biomolecular Simulation

Summary

Computational biologist with 8+ years combining **protein language models** and **molecular dynamics simulations** for enzyme engineering and drug discovery. Fine-tuned ESM-2 on 45K experimental stability measurements to screen 8,500 enzyme variants at 3,000× experimental throughput, with 5 hits confirmed by collaborators. Co-developed open-source transfer learning framework adopted by 4 external groups. 15 publications (7 first-author) in ACS Catalysis, J. Chem. Theory Comput., and J. Med. Chem.

Technical Skills

Molecular Simulation & Modeling

- GROMACS, OpenMM, AMBER – metadynamics, replica exchange MD, free energy perturbation
- AlphaFold2, Rosetta, AutoDock Vina – protein structure prediction and molecular docking
- CHARMM36m, AMBER ff19SB, OPLS-AA/M – force field benchmarking for disordered proteins
- Collective variable design, enhanced sampling protocol development, convergence analysis

Machine Learning & Data Science

- Protein language models (ESM-2), graph neural networks, transfer learning, active learning
- PyTorch, scikit-learn, BioPython – model fine-tuning, feature engineering, sequence analysis
- Regression, cross-validation, Spearman/RMSE benchmarking, dataset curation from public DBs

Programming & HPC

- Python, Bash, SQL – scientific computing, analysis pipelines, database management
- SLURM, Snakemake, Git, DVC – HPC workflow automation and reproducible research

Analysis & Visualization

- MDAnalysis, ProDy, PyMOL, matplotlib, seaborn – trajectory analysis, publication figures
- PostgreSQL, pandas – curated stability databases with automated quality filters for ML

Domain Expertise

- Protein engineering, enzyme thermostability, folding thermodynamics, drug discovery
- Intrinsically disordered proteins, ligand binding, biocatalysis, directed evolution

Research Experience

ML-Accelerated Protein Engineering and Computational Enzyme Design

Aug 2023 – Present

Postdoctoral Research Associate, Lakewood University

- Fine-tuned ESM-2 protein language model on 45K experimental melting temperatures, achieving 0.82 Spearman correlation and enabling 3,000× throughput screening of 8,500 enzyme variants for industrial thermostability.
- Co-developed transfer learning framework from protein language models reducing labeled training data by 60% across 5 enzyme families, released as open-source tool with 200+ GitHub stars.
- Extended protein language model to predict enzyme solvent tolerance across 8 organic co-solvent systems, validating against 50-ns explicit-solvent MD for 80 enzyme variants and identifying 4 candidates for green chemistry.
- Automated sequence-to-simulation pipeline using Snakemake workflow manager, reducing per-variant setup from 4 hours to 10 minutes and supporting 6 researchers across 3 active projects.

Enhanced Sampling Methods for Protein Folding and Ligand Binding

Aug 2018 – Jul 2023

Ph.D. Researcher, Westfield Institute of Technology

- Developed metadynamics-based enhanced sampling protocol for protein folding free energy landscapes, predicting folding temperatures within 8 K of experiment across 6 small proteins.
- Calculated relative binding free energies for 40 congeneric ligand pairs via free energy perturbation, achieving 0.9 kcal/mol RMSE against experimental IC50 data across 3 drug target families.
- Built curated protein thermostability database integrating 12,000 experimental melting temperatures from 3 public sources, with automated quality filters adopted by 8 lab members for ML training set construction.

Computational Biophysics and Structural Analysis

May 2016 – Jul 2018

Undergraduate Research Assistant, Eastgate University

- Performed homology modeling and 100-ns MD simulations of 4 mutant lysozyme variants, identifying destabilizing cavity mutations consistent with published experimental unfolding data.
- Built Python analysis scripts for automated hydrogen bond occupancy tracking across 500-ns aggregate trajectories, adopted by 3 lab members for ongoing protein stability projects.

Education

Ph.D., Biomedical Engineering Westfield Institute of Technology, Westfield, MA	Aug 2018 – Jul 2023 GPA: 3.92 /4.00
B.S., Biochemistry (Honors) Eastgate University, Portland, OR	Aug 2014 – May 2018 GPA: 3.87 /4.00

Selected Publications (15 papers | 280+ citations)

Honors & Awards

- **NSF Graduate Research Fellowship**, National Science Foundation (2019). Three-year fellowship supporting doctoral research in computational protein engineering.
- **Best Oral Presentation**, Westfield Biophysics Symposium (2022). Enhanced sampling methods for protein folding thermodynamics.
- **Dean’s Teaching Award**, Westfield Institute of Technology (2021). Outstanding TA in computational biology.
